The Propane Education and Research Council is responsible for the clean propane solutions that Americans trust today, and the innovations that they'll rely on tomorrow.

We do this by:

- **educating** consumers, professionals, and our industry partners alike with the latest workforce and consumer safety training and information.
- **funding** breakthroughs that expand the universe of clean, high-performing propane appliances for the home, and engines for power generation, school buses, medium-duty trucks, forklifts, port applications, agriculture applications, construction equipment, and more.
- **leading** a national dialogue about the role that propane plays in an equitable society—today and into the future.

We believe:

Everyone deserves access to energy. *Everyone.*

And the more affordable that energy is, the more equitable its distribution will be. Propane is an affordable energy solution that doesn't require trillions of dollars in infrastructure investments like electricity does. And propane equipment generally lasts longer than electric appliances, making them more cost-effective.

But the benefits for everyone go far beyond affordability. Because propane is also environmentally friendly. Using propane is an excellent way to reduce your emissions while meeting your energy needs. It's a clean, nontoxic energy source that will not contaminate soil or groundwater. And renewable propane sourced from used cooking oil and other waste products is carbon neutral.

With its additional advantages of reliability and versatility— for safe use at home, at work and on the road—propane is the energy for everyone.
